52. About this edition

Orientation: what V4.0 really adds

Evidence: Confirmed V4.0 handover / technical checkpoint

The musical point

Composer OS V4.0 develops a 24-bar piano source into a 48-bar orchestral varied reprise. Bars 25–48 reuse the piano material of bars 1–24; changing orchestral assignments create the reprise. It does not yet generate 48 bars of new piano development.

What is new

The documented V4.0 stages cover macro form (4A), motif and orchestration (4B), piano phrasing (4C), instrumental dialogue (4D), motif transformations and transitions (4E), dramatic arc (4F), review (4G) and Sibelius-ready notation/export (4H).

Start here

Choose an existing module, make a small musical idea, inspect its output, and then proceed to a larger arrangement only where the app supports the handoff.

The desktop at a glance

Evidence: Visible desktop screenshot; actual controls may require inspection

Finding your way

The provided screenshots show Generate, Arranger, Structure, Ensemble, Grid, Presets, Outputs, RiffGen, Solo Piano, Piano to chamber, Composer Engines, Pentatonic, Hexatonic, BHL, Practice & Scales Studio, Evaluation, Development Studio, Slonimsky Etudes, Performance Composer and Help.

Navigation

Use the labelled tabs as your map. A visible tab confirms an interface area exists, not that it integrates directly with every other engine.

Important build check

The supplied desktop screenshots identify build git 1c043e5, older than the 4H source checkpoint 9f722ecb. Rebuild the DEV app and verify its displayed build identifier before expecting the newest release functionality in the desktop UI.

First session: a safe musical workflow

Evidence: Musician-led exercise or practical guidance

1. Begin small

Open Solo Piano or RiffGen. Select an available preset or setting, generate or examine a short idea, then listen critically.

2. Evaluate

Notice contour, rhythmic character, harmony, register and phrase shape. Retain only material worth developing.

3. Export

Use the module’s actual visible output option. Where MusicXML is available, open the exported score in Sibelius to inspect notation, rather than assuming a passing test guarantees musical quality.

Artist profiles and tiers

Evidence: Visible desktop screenshot; actual controls may require inspection

What the screen shows

Composer Engines includes a search field and filters Pinned, Recent, Premium, Strong, Experimental, Library and All. The captures show names including Donald Fagen, Debussy, Charlie Parker, Robert Fripp, Radiohead, Kenny Wheeler, Maria Schneider, Messiaen, Monk, Reich / Glass and others.

How to read tiers

Premium, Strong and Library are labels displayed in the UI; the screenshots do not define their technical strength or guarantee equivalent output quality. Consult each profile’s description and current controls.

Combining with other modules

Treat cross-engine style influence as unconfirmed unless a selector or documented implementation explicitly connects the chosen profile to RiffGen, piano generation or orchestration. The manual does not claim one-click universal integration.

RiffGen: browse and make ideas

Evidence: Visible desktop screenshot; actual controls may require inspection

What exists

The pictured RiffGen interface exposes a 345-phrase browser, category and text filters, a needs-review filter and Style Pairings. Categories include bebop_jazz_blues, black_soul_funk, blues_rock, diminished_lines, jazz_rock, modern_rock, progressive_blues, sax_inspired, southern_rock, virtuoso_technique and white_rock_funk.

Crucial distinction

The screen explicitly says “Phrases.jsonl not wired into engine”. Browsing a phrase is not evidence that the phrase becomes input to the generator.

Creative use

Try a blues-rock groove, a modern-rock idea, a jazz-rock figure, a diminished-colour line or a saxophone-inspired response. Use the supported Generate route and compare the actual result with the browser selection.

Pentatonic: melody and colour

Evidence: Visible desktop screenshot; actual controls may require inspection

Why use it

Pentatonic collections are a compact source of motifs, melodic cells and practice ideas. Composer OS has a named Pentatonic tab and a known Pentatonic Engine development history.

Musical exercises

Write a short melodic cell using five notes; vary its rhythm; play it in a different register; alternate it with a contrasting five-note set; then note which variations sound coherent.

Integration limit

A Pentatonic tab is visible, but the supplied evidence does not show a direct Pentatonic-to-V4.0 orchestration button. Export and transfer only via interfaces confirmed in your build.

Hexatonic and BHL harmony

Evidence: Visible desktop screenshot; actual controls may require inspection

Six-note worlds

Hexatonic has its own visible tab. Treat named six-note collections as resources to explore, not as proof of a global cross-engine switch.

Bryant Harmonic Language

BHL prioritises colour, transforming harmonic material and retained common tones rather than default ii–V–I progressions. Previously documented worlds include triad pairs, harmonic quadratonics, major plus augmented, major plus diminished, pentatonic and unrelated major triads.

Try

Compose an eight-bar idea using two major triads with few shared functional assumptions. Retain one common pitch between neighbouring harmonies. Listen for the voice-leading, not a conventional cadence.

Solo Piano and natural phrasing

Evidence: Confirmed V4.0 handover / technical checkpoint

What 4C achieved

Phase 4C developed more natural piano rhythms and phrasing around the 24-bar source. An immutable golden reference protects the original Phase 4C example.

Listen for

Short and long phrases, rests, varied note lengths and the impression of a single unfolding musical thought.

Exercise

Compare a simple repeated motif to a version with staggered entries and breathing space. The comparison is a listening exercise, not a claim that each edit is directly exposed as a UI control.

Form, motifs and transitions

Evidence: Confirmed V4.0 handover / technical checkpoint

4A / 4B

Macro form shapes the wider plan; motif/orchestration work places and develops smaller cells.

4E

Motif transformations and sectional transitions help an idea remain recognisable while the context changes.

Exercise

Listen to three related appearances of a motif. Identify what survives (intervals, rhythm or contour) and what changes (register, timing, accompaniment).

Piano to Chamber: the idea

Evidence: Visible desktop screenshot; actual controls may require inspection

In plain English

Take piano material and assign musical roles to several instrumental voices: melody, bass, inner colour and response. That is the musical idea behind the label “Piano to chamber”.

What remains to verify

The screenshots establish that Piano to chamber is a tab. They do not establish its supported instruments, import workflow or whether it uses the same V4.0 orchestration path.

What to look for

When the rebuilt app is open, inspect its inputs, available ensembles, generation controls and export choices. Do not assume the arrangement is performance-ready without checking ranges and balance.

Development Studio: extend an idea

Evidence: Visible desktop screenshot; actual controls may require inspection

The question

You have a four-bar idea. How can it become music that lasts longer while retaining its identity?

Musical development

Possible musical techniques include repeat, displacement, fragmentation, inversion, contrasting answers and changed register. These are compositional ideas, not all verified Development Studio controls.

Verification point

The Development Studio tab exists, but the screenshots do not show its actual functions. Follow the options displayed in the rebuilt app rather than assuming it has every transformation listed here.

Orchestral dialogue and counterpoint

Evidence: Confirmed V4.0 handover / technical checkpoint

4D

Phase 4D introduced instrumental handoffs, dialogue and harmonic support within the orchestral plan.

An example from the released score

The second half assigns distinct four-bar spans to combinations including clarinet/viola (25–28), horns (29–32), oboe/cello (33–36), violin II/clarinet (37–40), then violin I/flute (41–44).

Listen for

Who carries the melody? Who answers? Who holds the harmony? Does the arrangement leave space for the next speaker?

Dynamics, register and climax

Evidence: Confirmed V4.0 handover / technical checkpoint

4F

The dramatic-arc work shapes dynamics, density and climax. In the 48-bar orchestration, melodic register peaks near bar 43; density climaxes in bars 45–47 before a reduced final bar.

What to inspect

Listen for whether the score earns its loudest moment. Verify that the thinner bars 25–40 support the intended build rather than feeling like an accidental drop.

Musical distinction

A dynamic mark and a measurable number of instruments are not the same thing as expressive musical drama.

The 48-bar varied reprise

Evidence: Confirmed V4.0 handover / technical checkpoint

The architecture

Bars 1–24 present the first orchestration; bars 25–48 reuse the same piano material with different instrumental assignments. This is a varied reprise, not a through-composed second piano half.

Second-half map

25–28 clarinet and viola; 29–32 horns; 33–36 oboe and cello; 37–40 violin II and clarinet; 41–44 violin I and flute; 45–47 full climax; 48 quiet, reduced close.

Repertoire idea

Use the example to study how changing colour alone can reframe a repeated melody.

Scoring review and BMEF

Evidence: Confirmed V4.0 handover / technical checkpoint

4G

The Phase 4G acceptance report documents score review. Technical tests and the user’s listening decision are deliberately distinct.

A useful listening checklist

Can you follow the principal motif? Are instrument entries convincing? Is the climax motivated? Does bar 48 release the tension? Are there awkward ranges?

A known concern

The handover flags cello register in bars 33–36 as potentially awkward. Treat this as a rehearsal/notation question, not as a verified impossibility.

Sibelius-ready release export

Evidence: Confirmed V4.0 handover / technical checkpoint

4H

Phase 4H introduced contextual enharmonic spelling, release metadata and rehearsal marks. The successful final checkpoint was 9f722ecb, with 17/17 varied-repeat and 82/82 release/general-piano test results.

Score landmarks

The release uses title “Seed 77241”, composer Mike Bryant and rehearsal marks A–F at bars 1, 9, 17, 25, 33 and 41.

In Sibelius

Import the MusicXML, inspect instrumentation/transpositions, rehearsal marks, spellings and final barline. Listen through the score independently; a passing export test is not a musical endorsement.

Other tabs: creative map

Evidence: Visible desktop screenshot; actual controls may require inspection

Composition and control

Generate, Arranger, Structure, Ensemble, Grid, Presets and Outputs are visibly accessible. Treat each as a separate area until its current controls are confirmed.

Study and performance

Practice & Scales Studio, Slonimsky Etudes and Performance Composer are visible. These warrant their own demonstrations in the comprehensive edition.

Quality and help

Evaluation, Diagnostics and Help appear in the desktop. Their presence does not mean they automatically certify a score’s artistic quality.

How pieces end

Evidence: Visible desktop screenshot; actual controls may require inspection

The screen

Composer Engines contains a “How pieces end” view alongside Composers and Generate.

Musical question

Does the piece close decisively, fade, suspend, stop abruptly or return to something familiar? Listen to how ending choices change musical meaning.

Caution

No available screenshot shows the ending controls or rules, so this guide does not assert which ending types are selectable.

Practical applications: 1–12

Evidence: Musician-led exercise or practical guidance

Ideas to try

01 Explore a blues-rock riff; 02 Compare modern-rock and jazz-rock categories; 03 Browse a diminished-line phrase; 04 Explore sax-inspired material; 05 Draft a five-note motif; 06 Create a contrasting pentatonic cell; 07 Compare two triads; 08 Make a common-tone harmonic change; 09 Produce a short piano sketch; 10 Listen for rhythmic breathing; 11 Try a more restrained phrase ending; 12 Open a result in notation.

How to interpret this page

These are musical exercises that use visible areas or established engines. They do not imply automated handoffs between modules.

Practical applications: 13–24

Evidence: Musician-led exercise or practical guidance

Ideas to try

13 Explore a named composer profile; 14 Compare two style descriptions; 15 Filter to Premium; 16 Review Strong profiles; 17 Browse Library; 18 Inspect Experimental; 19 Mark a favourite idea; 20 Examine RiffGen Style Pairings; 21 Listen for repeated motifs; 22 Compare A and contrasting B; 23 Note an effective transition; 24 Evaluate whether a final cadence feels earned.

Do not overclaim

Profile tiers and style pairing affordances are visible; the underlying profile-to-engine influence must be verified for each workflow.

Practical applications: 25–36

Evidence: Musician-led exercise or practical guidance

Ideas to try

25 Analyse a four-bar motif; 26 Compare transformed variants; 27 Listen for an instrument handoff; 28 Analyse sustained harmonic support; 29 Follow a theme across registers; 30 Compare two ensemble densities; 31 Trace the 24-bar dramatic arc; 32 Study the 48-bar varied reprise; 33 Mark the peak at bar 43; 34 Hear the climax at 45–47; 35 Inspect rehearsal marks; 36 Review the Sibelius MusicXML.

Progression

Work from a phrase, to a piano idea, to a form, to an instrumental treatment, to a score review.

Limits and future development

Evidence: Musician-led exercise or practical guidance

Known limitation

The 48-bar piano material is repeated, not freshly developed for bars 25–48. New longer-form piano development is identified as future V4.1 work.

Integration ideas, not shipped features

Possible future work includes a common style-profile control across engines, confirmed phrase-browser-to-RiffGen input, richer piano-to-chamber handoffs and seamless developmental workflows. None should be described as presently working without source confirmation.

The best next step

Verify the relaunched DEV desktop version, document each visible input/output path, then update the examples that need a real cross-module connection.

Detailed map: composer profiles

Evidence: Visible desktop screenshot; actual controls may require inspection

Choosing a profile

Open Composer Engines > Composers, search by name or use the Pinned, Recent, Premium, Strong, Experimental, Library or All filters. Read the description shown below the selected name before choosing it.

Visible evidence

One screenshot describes Donald Fagen as “7th/9th/13th + substitutions”; a Monk entry explicitly contains “placeholder”. Therefore a visible profile name does not prove completed musical behaviour.

Interpretation

A profile can be a useful musical reference without guaranteeing stylistic fidelity. Musical resemblance should be judged by listening to the output, not by tier labels.

Future development

A single audited map of profile parameters and which generation engines consume them would make the programme substantially clearer.

Profile workshops: jazz and modernism

Evidence: Musician-led exercise or practical guidance

Harmony

Compare a harmonically dense reference such as Donald Fagen with a more modal or open-textured reference. Write down the difference in voicing density, extensions and cadence pressure.

Melody

Compare a phrase shaped around intervallic movement with a more riff-driven idea. Keep the generated output separate from your expectations of an artist’s name.

Safety of claims

Do not claim the engine reproduces any artist’s copyrighted compositions. These are stylistic prompts and listening studies.

RiffGen phrase browser: closer look

Evidence: Visible desktop screenshot; actual controls may require inspection

The corpus

The screenshot reports 345/345 phrases and category counts: bebop_jazz_blues 33, black_soul_funk 54, blues_rock 30, diminished_lines 69, jazz_rock 12, modern_rock 33, progressive_blues 34, sax_inspired 18, southern_rock 27, virtuoso_technique 27, white_rock_funk 8.

Browsing

Use Category and Filter to narrow the phrase list; inspect a phrase by selecting it. The “Needs review only” checkbox appears in the browser.

Connection to generation

The visible warning “Phrases.jsonl not wired into engine” is explicit. Do not claim that selecting a corpus phrase changes the produced riff until the wiring exists and is tested.

RiffGen study projects

Evidence: Musician-led exercise or practical guidance

Guitar study

Create or examine a two-bar blues-rock hook and practise rhythmic displacement by starting the same notes on a different subdivision.

Groove study

Contrast black soul/funk and white rock/funk categories; listen for note lengths and syncopation rather than assuming a category label dictates output.

Colour study

Study diminished lines as tension material, then decide where the phrase resolves or remains suspended.

Pentatonic development exercises

Evidence: Musician-led exercise or practical guidance

Simple to complex

Start with a two-bar pentatonic cell, alter rhythm, sequence it, register-shift it, then create a call-and-response between two shapes.

Harmony

Try keeping the five-note material constant while changing the supporting triad. This is a musical analysis method, not a guaranteed integrated toggle.

Documentation limit

Detailed Pentatonic GUI settings are not present in supplied screenshots. A definitive step-by-step controls chapter requires the rebuilt interface or source file inventory.

BHL harmonic worlds

Evidence: Confirmed V4.0 handover / technical checkpoint

A: triad pairs

Use two triads as a source of melody and harmony, favouring a fluent relationship over dominant-tonic closure.

B/C/D

Harmonic quadratonics; major-plus-augmented; major-plus-diminished are documented harmonic worlds.

E/F

Pentatonic harmony and unrelated major triads widen colour options.

Exercises

Keep a common tone between successive sonorities; contrast stable open voicings with a more ambiguous harmonic passage.

Hexatonic and study integration

Evidence: Visible desktop screenshot; actual controls may require inspection

Engine

Hexatonic is shown as a top-level tab. It merits exploration alongside Pentatonic and BHL.

Exercise

Take a six-note collection and create two contrasting three-note gestures. Notice whether repetition, range or rhythm changes its perceived tonal centre.

Boundary

No authenticated cross-tab parameter bridge is shown. Treat the exercise as a musician’s workflow, not a verified automatic transfer.

Solo Piano: source and golden reference

Evidence: Confirmed V4.0 handover / technical checkpoint

24-bar source

The V4.0 example uses a Phase 4E 24-bar piano source. A separate immutable Phase 4C golden score preserves the earlier original.

Why it matters

A musical test must compare against the intended score. A prior mistakenly overwritten reference made a later output appear correct because both compared files had become the same.

Listening agenda

Assess the melody without orchestration first: does it have direction, silence, rhythmic life and a convincing ending?

Phase 4A: macro form

Evidence: Confirmed V4.0 handover / technical checkpoint

What form does

Macro form controls the perceived journey: establish, vary, contrast and return. It is not the same thing as choosing the number of notes.

Application

Sketch a two-part contrast: similar motif, different density and register. Make the structure audible before adding new counter-lines.

Interface caution

Phase 4A is a development phase, not independently verified as a named desktop control.

Phase 4B: motif and orchestration

Evidence: Confirmed V4.0 handover / technical checkpoint

Motif

A motif can be recognised by its interval pattern, rhythmic fingerprint or contour.

Orchestration

Move the recognisable figure between instrumental colours; keep the identity while changing emotional weight.

Review

Ask if the new instrument makes the music clearer or merely doubles what is already there.

Phase 4C: phrase naturalness

Evidence: Confirmed V4.0 handover / technical checkpoint

Breathing room

Natural musical phrasing is not constant activity. Rests, irregular starts and shifted emphasis create a feeling of intention.

Practice

Sing the 24-bar piano melody; mark where you would breathe. Compare those breaks to the score.

Limit

Phrasing improvements are confirmed in the development record; per-note humanisation controls are not established.

Phase 4D: dialogue

Evidence: Confirmed V4.0 handover / technical checkpoint

Conversation

Lead and accompaniment are roles that can change. An answering phrase gains meaning when the previous instrument leaves room.

Handoffs

Trace the melody across individual staves. Confirm whether material actually exists in the exported parts rather than only in an internal orchestration plan.

Earlier pitfall

The project once found missing notes in exported parts despite apparently correct planning checks. Actual MusicXML note events are the reliable evidence.

Phase 4E: transformations and joins

Evidence: Confirmed V4.0 handover / technical checkpoint

Variation

A familiar idea can return at another pitch level, in a different rhythm or with altered contour.

Section join

The accepted 48-bar method joins the same 24-bar piano score to itself and reorchestrates the reprise.

Boundary

This is distinct from an abandoned experiment attempting 48 newly composed piano bars.

Phase 4F: dramatic arc

Evidence: Confirmed V4.0 handover / technical checkpoint

Density

The 48-bar score is comparatively thin in bars 25–40, builds register around bar 43, thickens at bars 45–47 and reduces at bar 48.

Dynamics

The handover reports a crescendo at bars 15–16 and diminuendo at bars 47–48, with no rest-crossing hairpins in the external review.

Judgement

The presence of correct dynamics and hairpins does not replace listening to the transition between sections.

Reprise orchestration: bar-by-bar

Evidence: Confirmed V4.0 handover / technical checkpoint

Bars 25–32

25–28: clarinet and viola; 29–32: horns. The repeated piano score gains changing colour rather than new melodic content.

Bars 33–40

33–36: oboe and cello; 37–40: violin II and clarinet. Review cello register particularly carefully.

Bars 41–48

41–44: violin I and flute; 45–47: forte/full climax; 48: reduced, piano dynamic close.

Instrument ranges and transposition

Evidence: Confirmed V4.0 handover / technical checkpoint

Written versus sounding

Clarinets and horns are transposing instruments. Never claim a note is missing or colliding until you have accounted for written-to-sounding transposition.

Register issue

The earlier audit reports cello reaching an unusually high register in bars 33–36. It deserves musical inspection, not automatic rejection.

Actual evidence

Use Sibelius and the actual release MusicXML when evaluating instrumental practicality.

Phase 4G: evaluation and acceptance

Evidence: Confirmed V4.0 handover / technical checkpoint

Three verdicts

Technical PASS verifies defined behaviours; score-based musical evaluation inspects a written artefact; listening acceptance is the composer’s artistic decision.

Useful questions

Is the theme audible? Does orchestration sustain interest during repetition? Does density change intentionally? Is the final bar convincing?

No invented scores

Do not turn a qualitative BMEF review into numerical results without a documented rubric.

Phase 4H: MusicXML notation

Evidence: Confirmed V4.0 handover / technical checkpoint

Readable release

The release work adds enharmonic spelling appropriate to flat-key/chord contexts, title and composer metadata, rehearsal marks and final-barline handling.

Invariant

Sounding pitches, onsets, durations and instrumental assignments were required to remain unchanged from the accepted 48-bar baseline.

Checkpoint

At commit 9f722ecb, the targeted 17 varied-repeat checks and 82 other release/general-piano checks passed.

Practical Sibelius review

Evidence: Musician-led exercise or practical guidance

Open

Import the refreshed Seed77241-48bar-release.musicxml in Sibelius.

Inspect

Check visible title, Mike Bryant credit, A–F marks, full part labels, enharmonic notation and the final barline.

Hear

Audition both halves while watching the score; listen for melody preservation, contrast, orchestral balance and ending quality.

Do not assume

Successful import does not imply final artistic acceptance.

Piano to Chamber workflow study

Evidence: Visible desktop screenshot; actual controls may require inspection

Concept

Transfer roles from the piano texture to separate instruments: singing line, bass support, countermelody and harmonic sustain.

What to inspect in the actual app

Input selection, instrument list, export controls, and whether the produced score appears as separate playable parts.

Practical check

Try a sparse two-voice texture before attempting an elaborate chamber arrangement.

Unverified

This is a conceptual walkthrough, not a claim that a specific import button is present.

Development Studio workflow study

Evidence: Visible desktop screenshot; actual controls may require inspection

Starting material

A four-bar motif may need contrast, repetition, fragmentation or stronger harmonic pacing before it can support a complete section.

Write down

For each variation, identify one retained fingerprint and one deliberate change.

App check

Inspect the controls actually available in Development Studio; no supplied screenshot documents its transformation commands.

Arranger, Structure, Ensemble, Grid

Evidence: Visible desktop screenshot; actual controls may require inspection

Visible tabs

These four names appear in the desktop navigation and must be mentioned in a complete user guide.

Use safely

Inspect each tab’s active controls, presets, validation and export options in the rebuilt application.

No imaginary pipeline

A UI section does not establish a seamless Arranger-to-Ensemble-to-Grid pipeline; describe such relationships only after confirming how the data moves.

Presets and Outputs

Evidence: Visible desktop screenshot; actual controls may require inspection

Presets

The Presets tab is present. Presets can conceptually make experiments reproducible, but their exact stored fields are not shown.

Outputs

Use the Outputs area to locate products of a generation only where those files are actually surfaced.

Reproducibility

Save the available seed, style selection, settings and resulting file names as part of each musical experiment.

Practice, Slonimsky and performance

Evidence: Visible desktop screenshot; actual controls may require inspection

Practice & Scales Studio

A top-level practice area is shown; it belongs in the programme overview.

Slonimsky Etudes

The named study engine is visible; any exact permutation or exercise controls require verification.

Performance Composer

This module is visible and conceptually relevant to playable instrumental writing; its actual instrument and export options are not established by the supplied captures.

Evaluation, Diagnostics and Help

Evidence: Visible desktop screenshot; actual controls may require inspection

Evaluation

A tab labelled Evaluation appears in the UI. It must not be equated with independent listening acceptance.

Diagnostics

A collapsible Diagnostics section is visible in several screenshots.

Help

A Help tab exists, though its current contents have not been provided.

Cross-engine integration: confirmed vs proposed

Evidence: Musician-led exercise or practical guidance

Confirmed

The V4.0 pipeline contains a 24-bar piano source, motif and form development, orchestral distribution/dialogue, a 48-bar varied reprise and MusicXML release.

Not confirmed

No evidence provided proves that every Composer Engines artist profile drives Pentatonic, RiffGen, Piano to Chamber and Development Studio simultaneously.

Future design candidates

Verified profile compatibility flags; consistent import/export contracts; genuinely new 48-bar piano development; corpus-backed RiffGen selection; richer instrument-role mapping.

Extended applications: 37–48

Evidence: Musician-led exercise or practical guidance

Advanced ideas

37 Compare orchestral handoffs; 38 Examine violin/flute register; 39 Investigate cello tessitura; 40 Assess texture density; 41 Hear the 4F climax; 42 Study a diminuendo; 43 Compare 4C/4E piano versions; 44 Read 4G observations; 45 Verify flat-chord spellings; 46 Inspect part labels; 47 Navigate A–F rehearsal marks; 48 Plan a revision after listening.

Level of support

These exercises analyse confirmed score material; they do not imply the desktop exposes all transformations as interactive commands.

Extended applications: 49–60

Evidence: Musician-led exercise or practical guidance

Studio explorations

49 Build a motif notebook; 50 Compare pentatonic gestures; 51 Study six-note collections; 52 Contrast triad-pair movements; 53 Organise stylistic influences; 54 Compare phrase-browser categories; 55 Explore the concept of chamber role assignment; 56 Trace theme recurrence; 57 Plan a film-like dramatic arc; 58 Catalogue compelling endings; 59 Save notation examples; 60 Write a listening acceptance note.

Keep claims grounded

Every exercise is framed as musician-led study or as a supported score inspection, rather than an invented automated composition feature.

Release checklist and known gaps

Evidence: Musician-led exercise or practical guidance

Before delivery

Verify rebuilt desktop build identity; generate a known score; compare actual exported file; import into Sibelius; listen; review notation.

Caveats

Known handover limits include repeated piano material, comparatively sustained counterpoint, high cello register and orchestral-density changes.

Documentation hygiene

Add GUI-specific step numbers only after inspecting the current application. Do not describe speculative buttons.

About this edition

Scope

Prepared from Composer V16 handover (21 October 2026), reported Phase 4H closure at 9f722ecb, and supplied Composer OS DEV screenshots. The source repository and newest live desktop build were not accessible for direct inspection.

Evidence key

“Confirmed” means documented in the V4.0 handover or terminal receipts. “Visible” means present in a supplied UI screenshot. “Guide” means a suggested musician-led exercise, not automatically implemented functionality.

Editorial standard

No undocumented buttons, input pipelines, artist-profile-to-engine integrations or unsupported 48-bar generation capability are presented as shipped features.

Artwork

Cover artwork uses the supplied guitar portrait and Third Sun Records logo. Tarot-inspired symbols serve only as decorative motifs; they are not Composer OS functions.

· Back to Contents

A practical, musician-friendly guide to
help you get the most out of Composer OS.
Create, organize, and bring your musical ideas
to life — with clarity, flow, and freedom.
